NOTE 1: The New England Common Assessment Program (NECAP) Science Assessment is the result of collaboration among New Hampshire, Rhode Island, and Vermont to build a set of tests for grades 3 through 8 and 11 to meet the requirements of the No Child Left Behind Act (NCLB). The purposes of the NECAP Science tests are as follows: (1) provide data on student achievement in science at grades 4, 8, and 11 to meet the requirements of NCLB; (2) provide information to support program evaluation and improvement; and (3) provide information regarding student and school performance to both parents and the public. The tests are constructed to meet rigorous technical criteria, to include universal design elements and accommodations to allow all students access to test content, and to gather reliable student demographic information for accurate reporting. It is important to note that NECAP results are provided to districts, schools, and families for use as one piece of evidence about progress and learning that occurred on the respective grade-span expectations (GSEs) of elementary (K-4), middle (5-8) and high schools (9-11).

NOTE 2: Throughout this report, ***statistical significance*** is reported to indicate whether reported differences (e.g., increases or decreases in the percentage of students achieving *proficiency* or higher) in this year's NECAP results are *significantly* different from results reported in previous years. For each table presented in this report, please note the key to determine the meaning of color-coded cells. In general, if a cell is colored **green**, then the reported difference indicates that the percentage of students achieving *proficiency* or higher, for example, is statistically significantly **higher** than previous results whereas if the cell is **red**, then the reported difference indicates that the percentage of students achieving *proficiency* or higher is statistically significantly **lower** than previous results. All other reported differences are thus not considered statistically significant, regardless of how large or small they appear to be. Please see Appendix B for a full discussion on how statistical significance was calculated and how to interpret statistical significance.

NOTE 3: Throughout this report, the percentage of students scoring *Proficient* or higher refers to the cumulative percentage of students scoring at the *Proficient* and *Proficient with Distinction* levels of achievement. See Appendix A for descriptions of each of the levels.

NOTE 4: Multiple data points are needed for trend analysis. A single year's test results provide limited information about a school or district. As with any evaluation, test results are most meaningful when compared with other indicators and when examined over several years for long-term trends in student performance. This is especially true in small schools where changes in student cohorts from year to year can have a noticeable influence on test results. Because measures of student achievement often change incrementally over short periods of time, RIDE presents most state-, district-, and school-level results in this report as a series of multiple-year views in order to reveal achievement trends that have occurred over several years. In addition, RIDE presents last year's results to illustrate a one-year view. In general, over the eight-year period between 2008 and 2015, a statistically significant increase indicates improvement that has been sustained. Conversely, a statistically significant decrease indicates a sustained decline in achievement.

EXECUTIVE SUMMARY

The eighth administration of the New England Common Assessment Program (NECAP) Science tests took place May 4-28, 2015. A total of 31,016 Rhode Island public school students in grades four, eight, and eleven participated in NECAP Science testing.

STATE-LEVEL RESULTS

Overall Achievement

Results of the spring 2015 NECAP Science tests revealed that at the *state level*,² roughly 31 percent of all Rhode Island public school students were proficient or above in science (down less than 1 percentage point from the May 2014 administration). While all three tested grades had significantly higher percentages of students achieving proficiency compared to the first administration of the science test back in 2008, no grades posted significant gains in 2015 compared to 2014. Scores for students in grades 4, 8, and 11 were essentially the same as last year.

Since the first administration of the NECAP Science Assessment back in 2008, Rhode Island has seen the largest growth in student achievement at all grade levels among the NECAP states. In 2015, Rhode Island's 4th graders' scores remained statistically the same as last year while their peers in New Hampshire and Vermont posted a 3 and 2 percentage point increase respectively in the percent achieving proficiency or above. Results indicate that Rhode Island's 4th graders continue to lag behind their peers' science achievement in both New Hampshire and Vermont. Results at grade 8 indicate that New Hampshire and Vermont students out-performed Rhode Island's 8th graders by 3 and 2 percentage points respectively while at grade 11, the gap between our students and their peers in Vermont has been eliminated. The gap between our 11th graders and their peers in New Hampshire has widened by 2 percentage points.

Achievement Gaps³

Statewide (*all grades combined*), the achievement gaps in Science between LEP and Non-LEP students have narrowed since 2012 although they remain wider than they were back in 2008. The achievement gaps between students with IEPs and their peers without IEPs have widened since last year and also remain wider than they were in 2008. The same is true for the achievement gaps between low-income and non-low income students.

² All grades combined for a single aggregated result.

³ An achievement gap is a difference in what distinct groups of students know and can do in important subjects such as reading, math, or science. One way we find achievement gaps is by comparing test performances of different groups of students. One way we describe gaps is by subtracting the average of a lower scoring group from the average of a higher scoring group.

DISTRICT⁴ RESULTS

Compared to last year's results, there was some improvement at the district level this year in terms of student achievement in Science. Of Rhode Island's 56 districts that participate in NECAP Science testing, seven posted a significant gain in science achievement while three posted a significant decrease in overall student performance. For all other districts, scores were essentially the same as last year. By comparison, over the eight-year period from 2008 to 2015, 66 districts posted significant gains in Science while two posted a significant decrease in overall student performance.

SCHOOL RESULTS

Results at the school level mirrored those of district level in that for the vast majority, Science results were not significantly different than last year's. A total of nine schools posted significant increases in the percentage of students achieving proficiency or above in Science while six posted significant decreases. Over the eight-year period from 2008 to 2015, there were a large number of schools that posted gains in Science. A total of 55 schools made gains while only seven schools had lower percentages.

⁴ Throughout this report, the term "district" is used as an inclusive identifier of both traditional districts and charter schools, both of which are "Local Education Agencies" or LEAs.

⁸ Eligibility for free or reduced price meal benefits through the National School Lunch Program is the most commonly used indicator of economic disadvantage.⁹ An achievement gap is a difference in what distinct groups of students know and can do in important subjects such as reading or math. One way we find achievement gaps is by comparing test scores for groups of students. One way we describe gaps is by subtracting the average of a lower scoring group from the average of a higher scoring group.¹⁰ Because scale scores differ across grades, it is not possible to create an aggregated “state” scale score for comparison purposes in this table.

Key

- = Statistically significant *decrease* in total percent of students *proficient* or above
- = Statistically significant *increase* in total percent of students *proficient* or above
- = No statistically significant difference between comparison years' total percent of students *proficient* or above
- SE = Standard error (see Appendix B)
- N = Number of students tested

SCHOOL RESULTS

Table 10. Percent of Students At/Above “Proficient” in Science by School.

“Minimum Cell Size” Reporting Policy

RIDE Policy on minimum cell size for reporting data stipulates that if the number of students is less than 10 for any group(s) or for any school- and district-level reporting or if a percentage is less than 1% or greater than 99%, then data must be suppressed in public reports to ensure confidentiality of individual student results and to discourage generalizations about school performance based on very small populations. Throughout this report, empty cells indicate that the number of students included in calculations was less than 10 or the percentage was less than 1% or greater than 99%.

NECAP Performance Level Descriptors

- **Proficient with Distinction:** Students performing at this level demonstrate the prerequisite knowledge and skills needed to participate and excel in instructional activities aligned with the GSEs at the current grade level. Errors made by these students are few and minor and do not reflect gaps in prerequisite knowledge and skills.
- **Proficient:** Students performing at this level demonstrate minor gaps in the prerequisite knowledge and skills needed to participate and perform successfully in instructional activities aligned with the GSE at the current grade level. It is likely that any gaps in prerequisite knowledge and skills demonstrated by these students can be addressed during the course of typical classroom instruction.
- **Partially Proficient:** Students performing at this level demonstrate gaps in prerequisite knowledge and skills needed to participate and perform successfully in instructional activities aligned with the GSE at the current grade level. Additional instructional support may be necessary for these students to meet grade level expectations.
- **Substantially Below Proficient:** Students performing at this level demonstrate extensive and significant gaps in prerequisite knowledge and skills needed to participate and perform successfully in instructional activities aligned with the GSE at the current grade level. Additional instructional support is necessary for these students to meet grade level expectations.

APPENDIX B

Calculating Standard Error (SE)

For the purposes of this report, *Standard Error (SE)* is defined as a measurement of the standard error of a percentage (e.g., % *Proficient*, used throughout this report). Mathematically, SE's were calculated as follows:

$$(SE) = \sqrt{\left(\frac{pq}{N}\right)}, \text{ where } p \text{ is the percent of students who are proficient, } q = (100-p) \text{ and } N \text{ is the population or group size.}$$

It is important to note that the derived SE is based on the size of the group being examined and its respective performance (read: % *Proficient*) on the NECAP tests. Standard errors can be used to create a confidence interval around the derived percentage so that you can see the range in which the “true” (e.g., measured without error) value is located. To do so, you can take the SE and multiply it by 1.96 (for a 95% confidence interval). The resultant product is then added and subtracted from the percent proficient, *p*, for example, to create a range of values in which you can be 95% confident that the “true” value is located. For example, viewing the percent proficient (*p*) as the center point, if one adds the value of SE(1.96) to *p* and also subtracts this value from *p*, then the full confidence interval is created with both an upper and lower boundary. So, if *p* equals 70% and the SE equals .5, then the product of SE and 1.96 equals .5(1.96) or .965 Adding and subtracting this number from 70% creates the confidence interval, which ranges from 69.04% to 70.97%. This is the range in which one can be 95% confident that the “true” value exists.

When comparing the performance of any two years or groups, we say that the difference in performance between the groups is *statistically significant* if the difference in performance between the two groups is larger than the sum of the SE's of the two groups. In other words, if the sum of the two SE's—each multiplied by 1.96 to get the 95% confidence interval—is larger than the value of the difference in performance between the two groups, then we say the difference is too small to be significant or meaningful because the difference doesn't fall outside of the range of plausible “true” values. To illustrate this point, let's say that 60% of 4th grade students at *School X* were proficient or above in science in 2013 and the following year in 2014, 66% of 4th grade students were proficient or above, thus resulting in an increase of +6 percentage points. If the sum of the 2013 SE(1.96) and the 2014 SE(1.96) is 6.5, then the change from 2013 to 2014 in 4th grade reading performance of +6 percentage points at *School X* is not large enough to be considered statistically significant. On the other hand, if 67% of 4th graders in 2014 were proficient or above, then the +7 percentage point increase in performance would be larger than the standard error of 6.5 and this difference would be statistically significant.
